Learn how to use the `Option UTF16` config.txt directive to specify that content sent using UTF-16 is transformed into UTF-8 and processed by EZproxy. `Option UTF16` specifies that content sent using UTF-16 encoding should be transformed into UTF-8 and processed by EZproxy. UTF-16 and UTF-8 are UNICODE standards for encoding character sets, especially for international characters. The main purpose for this option is to support the Chinese database Siku Quanshu.

`Option NoUTF16` is the default behavior for EZproxy and indicates that UTF-16 content should not be processed by EZproxy.

`Option NoUTF16` is a repeatable position-dependent config.txt directive that interacts with database stanzas, following database stanzas until overridden.

### Syntax

- `Option UTF16`

### Example

Enable UTF-16 processing for Siku Quanshu, but disable it for Other Database and any databases that follow Other database.

- `Option UTF16`
- Title Siku Quanshu
  - URL http://skqs.yourlib.org
  - DJ skqs.yourlib.org
- `Option NoUTF16`
- Title Other Database
  - URL http://www.otherdb.com
  - DJ otherdb.com
