Learn how to use the Option UTF16 config.txt directive to specify that content sent using UTF-16 is transformed into UTF-8 and processed by EZproxy.

Option UTF16 specifies that content sent using UTF-16 encoding should be transformed into UTF-8 and processed by EZproxy. UTF-16 and UTF-8 are UNICODE standards for encoding character sets, especially for international characters. The main purpose for this option is to support the Chinese database Siku Quanshu.

Option NoUTF16 is the default behavior for EZproxy and indicates that UTF-16 content should not be processed by EZproxy.

Option NoUTF16 is a repeatable position-dependent config.txt directive that interacts with database stanzas, following database stanzas until overridden.

Syntax

- Option UTF16

Example

Enable UTF-16 processing for Siku Quanshu, but disable it for Other Database and any databases that follow Other database.

- Option UTF16
- Title Siku Quanshu
- URL http://skqs.yourlib.org
- DJ skqs.yourlib.org

- Option NoUTF16
- Title Other Database
- URL http://www.otherdb.com
- DJ otherdb.com
