How can I search using Z39.50 in Connexion client?

Last updated: Mon, 01 Jul 2019 14:54:32 GMT

Applies to

- Z39.50 with Connexion client

Answer

The purpose of the Z39.50 link in Connexion client is to transfer records from the library's local system to the Connexion client, and then upload the records to WorldCat. The library likely has record IDs for their original records. The record IDs are probably the best way to locate their records using this Z39.50 option.

The library needs to configure Connexion client before the Z39.50 transfer can work. Go to **Tools > Options > Z39.50** to set up this configuration in Connexion client. Open the Z39.50 tab, and then click **Help** to display the online documentation for details.
