External IP address for Hosted members

Applies to

- All EZproxy Versions

Answer

- If you know your server name such as oclc.idm.oclc.org, you can do a nslookup command from a command prompt and get the IP address. At a command prompt, you type in:

  `nslookup [server code].idm.oclc.org`

  in this case, it would be:

  `nslookup oclc.idm.oclc.org`

  You will get the IP address in the response.

- Or for Hosted EZproxy contact [OCLC Support](https://help.oclc.org/Library_Management/EZproxy/Troubleshooting/Find_EZproxy_Hosted_External_IP_Address).

- Or for a Standalone EZproxy. You will have to contact your IT as they will know what IP is assigned to your server.
