How do I turn off TLS 1.0 and TLS 1.1 protocols in EZproxy

Last updated: Fri, 11 Nov 2022 16:18:17 GMT

Symptom

- EZproxy is allowing SSL protocols that you do not want it to allow

Applies to

- EZproxy version 6.1.13 and newer

Resolution

1. SSLOpenSSLConfCmd Protocol -TLSv1, -TLSv1.1 can be used if the first version does not work.

Additional information

This command SSLOpenSSLConfCmd Protocol can also be used as a negative(-) to remove specific protocols from being allowed. SSLOpenSSLConfCmd Protocol -TLSv1 is an example to stop EZproxy from accepting TLS 1 protocols.
