When do I need to restart an ILLiad Service?

Last updated: Thu, 18 Jun 2020 16:22:56 GMT

Symptom

• You want to know when you need to restart an ILLiad Service

Applies to

• ILLiad

Resolution

Here is the list of other services and what needs to be restarted:

1. ILLiad Odyssey Manager - Anything working with the sending and receiving of electronic articles.

2. Connection Manager - Anything that works with the Updating OCLC or downloading requests.

3. ILLiad System Manager - Anything dealing with email sending or receiving. Also, if you made a change to a Server Addon or add a new Server Addon or any Server Addon keys in the Customization Manager.

4. ISO ILL - If you are using ISO ILL and requests are not sending or receiving.

5. IIS - If you are updating your Web page interface settings, then you need to restart IIS. If you are updating Web pages, you do not need this restarted. If you make changes in the ILLiad WebPlatform settings, you need to restart IIS.

6. Rapid Manager - if you make a change in the ILLiad Rapid Manager service, or you are not able to send or receive information from or to Rapid.

If you are hosted by OCLC, please contact OCLC Support to restart your services.
