Discover problem logs, version information and RSDs for your OLIB system.
► System Administration> Problem Log
► System Administration> Version Info

**Problem log**

The Problem log records any problems with automatic and manual processes encountered in OLIB, for example:

- Data imports (users or bibliographic)
- Automated overdue notices
- Fine generation
- Serial Issue generation. This reports on serial copies that are failing to generate issues. The Serial Copies domain includes a Serial Copy No. search to help you track down problem copies.

Many of the items logged here are auto-created from the Daystart program. It is recommended that the system manager checks the Problem Log periodically and deletes older problems, otherwise the log can become very large.

**Version info**

This domain lists the version numbers of the modules installed on your system and which Rapid Software Deployments (RSD - bug fixes) have been installed.
