Automated Request Manager

Use this screen to configure Automations in Automated Request Manager (ARM) to automate ILL workflows. As a feature of Smart fulfillment, use the Automated Request Manager (ARM) screen to configure automated ILL workflows. Automations are composed of match criteria you define along with actions you want the system to perform on matched requests.

To access this screen, sign in to OCLC Service Configuration, open the WorldShare ILL module from the left navigation, and then select Automated Request Manager.

Notes:

• Previously configured Direct Request Profiles will appear in the Automated Request Manager as Automations.
• When the Persistence Setting is turned On in the OCLC Service Configuration > WorldShare ILL > Interlibrary Loan Options module, the DEFAULT constant data record overrides other Constant Data applications including through automation. If using automations to apply constant data, turn off the Persistence Setting. See Interlibrary Loan Options.

Automations are a combination of:

• Matches: What the request should look like.
• Actions: What the system should do with the request.
• Exceptions: When you do not want these actions to occur.
• Priority: If a request matches multiple automations, which set of actions should be performed.

Automations allow you to determine how patron-generated requests are processed. First, you can configure match criteria based on details in the request:

• Age of material requested
• Format of material
• Language of material
• Patron’s need by date
• Patron’s department
• Presence of a patron note
• Contents of a patron note (keywords or exact phrase matches)
• Patron’s status
• Patron’s maximum cost
• Request Source (ILL system or interface where the request was submitted)
• Request Type (Copy or Loan)
Once you have determined which requests you would like to automate, Automations can be configured with actions to:

- Apply your selected constant data record to new borrowing requests.
- Build a lender string (which adds the lender string to the request based on a **Custom Holdings Path** and moves it to review).
- Send request to lenders (based on a **Custom Holdings Path**).
- Route requests to the Review for Purchase queue.
- Route requests to Review.

You can also configure exceptions in Automation, which apply instead of the defined actions when they are true. Those include:

- Routing requests for items your library owns to review
- Routing duplicate requests to review
- Routing requests owned by libraries in a Custom Holdings Group you define to review

OCLC recommends creating at least one Automation for loans and one for copies. Keep the following in mind when you are configuring automations:

- Automations are applied based on the Automation **Priority** setting. A patron-generated request is compared against all automations. Of all the automations that match the request, the automation with the highest priority, or lowest assigned Automation Priority number, will be applied to the request.
  - Each automation must have a unique numerical value for Automation **Priority**.
  - Assign the highest **Priority** (lowest number) to your most specific automations.
- Each automation must have at least one Match, Action, or Exception (not one of each).
  - If you do not select any match criteria, your automation will apply to all requests.
  - If you select matches but not actions or exceptions, all requests matching that automation will be routed to review.

### Standard Actions

At the top of the screen is a list of the standard actions the system automatically performs on new borrowing requests.

- Bibliographic record matching
- WorldCat holdings check
- Knowledge base holdings check
- Custom Holdings Group check

### Configure Main Automations

To add an automation:

1. Click + **Add New**.
2. Enter a Name and assign a Priority. See Main Automation fields for more information.

3. Select any desired match criteria from the Matches drop-down menu. See Automation Match criteria for more information.
   - If you do not select a match criteria, the automation will apply to all requests.
   - Click the Add a match button to configure additional match criteria.

4. Select any desired actions from the Actions drop-down menu. See Automation Actions for more information.
   - Click the Add an Action button to configure additional match criteria.

5. Click the Add an Exception option to select any Exceptions. See Automation Exceptions for more information.
   - If any exceptions are true on a matched automation, only the exception will apply and the rest of the selected actions will not apply.

6. Click Save.

To edit an automation:

1. From the Main Automations list, select the Edit button associated with the desired automation.
2. Edit information, as appropriate. Remove matches, actions, and exceptions with the remove button.
3. Click Save.

To delete an automation:

1. From the Main Automations list, select the Delete button next to the desired automation.
2. On the confirmation window, click Delete.
## Main Automation fields

<table>
<thead>
<tr>
<th>FIELD</th>
<th>DESCRIPTION</th>
</tr>
</thead>
</table>
| **Name*** | The name of this automation (20-character limit, with no special characters) that indicates the scope of the group of requests to which the automation pertains. The name must be unique.  

**Note:** Names are not case sensitive, so, for example, **TEST** is the same as **test**.  

**Examples:**  
EARTICLTEST  
MAXCOPY  

**Note:** If you had included a Description on your previously configured Direct Request Profiles, the description will appear as read-only text on the Automation. |
| **Priority*** | Set a numeric priority to each automation.  

- When a patron initiated request is generated, it is compared to all configured automations. When requests match multiple automations, the automation with the highest priority, or lowest number, will be assigned to the request.  
  - Each automation must have a unique numerical value for **Priority**. |
Automation Match criteria
<table>
<thead>
<tr>
<th>FIELD</th>
<th>DESCRIPTION</th>
</tr>
</thead>
</table>
| Age of Material  | **For Loans:**
Used to restrict the borrowing of items that are either very new or very old based on their publication date.

**Note:** The number you type in *Age of Material* must be smaller than the number you type in *but no older than*.

**For Copies:**

*Age of Material* can be used to designate whether the copy request is CCG or CCL. The age is pulled from the *Article Date* field. Libraries can set a Copyright designation using Automations. A copy-based request that comes through Automation with an Article date field of 1994 could be matched to an Automation with CCL in the copyright Compliance field.

Type a whole number from 1-1000 representing the age of the material in years.                                                                                                                                                                                                 |

| Formats          | • One or more bibliographic formats that a request must specify if it is to match the automation.  
• Select a format from the list provided.                                                                                                                                                                                                                                          |
| Languages        | One or more languages that a request must specify if it is to match the automation.                                                                                                                                                                                                                                                        |

| Need at Earliest | • Used to define a date range, if any, within which the patron must receive the material.  
• In a loan request, the patron’s date requirement is specified in the field named *Need Before*. For example, a *Need Before* value of 4 means that the patron must receive the material within four days of creating the request. To match the automation, the *Need Before* value in a request must fall within the range you specify in the automation by values you associate with *Need At Earliest* and *but no later than*.  
• For example, if the automation has a *Need At Earliest* value of 4 and a *but no later than* value of 7, an incoming request with a *Need Before* value of 5 will match the automation. However, if the patron specifies a *Need Before* value of 3 in the requested date, the request would not match the automation.  

https://help.oclc.org/Resource_Sharing/WorldShare_Interlibrary_Loan/Smart_fulfillment/015Automated_Request_…
request, the request will not match the automation.

• Type a whole number from 0-1000.

• Patron department or departments, if any, to which the automation applies, up to 65 alpha-numeric characters long.

• Patron department is not case sensitive, so CompSci is the same as compsci. Spelling is important, however, so CompSci is not the same as CSCI.

Patron Departments

• If the automation applies to more than one department, type each department separated by comma.

Examples:
CompSci
Chemistry
Biology

Patron Note

Indicates if a patron has entered a note on the request. Match on:

• Check the Any words checkbox to retrieve requests that have any patron note.

• Enter keywords or phrases into the text box to retrieve requests containing patron notes with the specified keywords or phrases.

  ◦ When multiple terms are entered, they are connected with the Boolean operator of OR.

Patron Statuses

• Patron status or statuses, if any, to which the automation applies, up to 65 alpha-numeric characters long.

• Patron status is not case sensitive, so Grad is the same as grad. Spelling is important, however, so Grad is not the same as Graduate.

• If the automation applies to more than one status, type each status separated by comma.

Examples:
Grad
UnderGrad
Faculty

Patron Will Pay Up To

- The amount (in US dollars), if any, the patron will pay for the requested material.
- If matching on patron’s max cost, consider making the field required on request forms, as null values will never match an automation with this criteria.
- For a request to match an automation, the amount specified in the request must be equal to or greater than the amount specified in the automation. For example, if the request specifies 7 ($7.00), and the automation specifies 5 ($5.00), the request matches the automation—a patron willing to pay $7 is also willing to pay $5. On the other hand, if the automation specifies 10, then the automation does not match, because a patron willing to pay $7 is not willing to pay $10.
- Type a number. Do not type the dollar ($) symbol. A value of 0 means that the patron is not willing to pay anything for the material being requested.

Examples:
6
6.00
6.10

Request Sources

- Indicates if the source of a request is relevant to the automation, and if so, the source name or names.
- If you want the automation to apply to requests from particular sources, type the names of the sources in the box provided, separated by comma. Source names can be up to eight alpha-numeric characters. The values must be valid values in your ILL requests.
- Source names are not case sensitive, so FSILL is the same as fsill. Spelling is important, however, so FSlink is not acceptable as the valid value FSILL.
- See ILL sources for more information.

Examples:
FSILL
FSlink
### Request Type

- **Loan** - Only requests for loans will match the automation.
- **Copy** - Only requests for nonreturnable copies will match the automation.

### Automation Actions

Note: Some Actions are mutually exclusive from others. Unavailable actions are automatically removed as you build the automation.

<table>
<thead>
<tr>
<th>FIELD</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply Constant Data</td>
<td>Select the Constant Data record, if any, that you want to apply to the requests matching this automation. Once you select this action, you will see a dropdown list of all current Constant Data records for your institution.</td>
</tr>
<tr>
<td></td>
<td>• The Constant Data record, if any, that applies to the group of requests you are automating. The list contains all current Constant Data records for your institution.</td>
</tr>
<tr>
<td></td>
<td>• Select a Constant Data record from the list provided. Do not select from the list if no current Constant Data record applies to the group of requests you are automating.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you want to define a Constant Data record for this group, create the Constant Data record before creating the automation.</td>

</tbody>
</table>

**Available additional Actions**

- Build Lender String
- Route Request to Review
- Send Request to Lenders

| Build Lender String | Select this option if you want to build a lender string on the request without sending the request automatically out to lenders. Once you select this option, you will be asked to select a **Custom Holdings Path** from the full list of Custom Holdings Paths currently configured for your institution. |
institution. The matching requests will have lender strings applied and moved to review.

- See Custom Holdings Paths for more information.

**Available additional Actions**

- Apply Constant Data
- Route Request to Review

Automation builds a lender string that considers the following:

- **Deflections**: Libraries deflecting for a reason that would impact your request are not included in the lender string. This includes service type, format, borrower’s max cost, group affiliation, e-license terms, or material age. Automation history will show lenders that were excluded because of deflection so that you can adjust the request upon resubmit for a more favorable response.

- **OCLC knowledge base coverage range**: Holdings are added from the WorldCat knowledge base where the lender holds the year or volume requested.

- **Electronic license terms**: Holdings are added from the WorldCat knowledge base where the lender has a license that allows ILL.
  - **Print Serials**
    - Lenders will be added to the lender string if they:
      - Hold the requested year or volume based on the information in the 853 and 863 fields of the Local Holdings Record (LHR).
      - Have LHRs for the title but the system cannot determine if holdings match the requested item.
      - Do not have a title-level deflection in the 008 field of the LHR indicating they will not lend or copy the item.
    - The lenders are then sorted by turnaround time.
  - **Turnaround time**
    - Turnaround time is calculated from when a lender is assigned a request to the time when the item is available to the borrower.
<table>
<thead>
<tr>
<th>FIELD</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>▪ For Loans: the time from when the lender was assigned to when the borrower received the item.</td>
</tr>
<tr>
<td></td>
<td>▪ For Copies: the time from when the lender was assigned to when the lender shipped the item.</td>
</tr>
<tr>
<td></td>
<td>◦ Lenders are sorted by turnaround time within each <a href="#">Custom Holdings Group</a> in a Custom Holdings Path. User's preferences for ordering the lender string are retained. Turnaround time order is determined by the below calculations to create the best lender string for each request without overwhelming lenders who have a quick turnaround time:</td>
</tr>
<tr>
<td></td>
<td>▪ The system calculates a daily average turnaround time for lenders based on historical data from the past year. This average turnaround time is recalculated daily.</td>
</tr>
<tr>
<td></td>
<td>▪ Each library’s current queue depth or number of outstanding lending requests is considered upon assigning requests. The current queue depth is calculated hourly.</td>
</tr>
</tbody>
</table>

**Route Request to Review**

Automation will move matching requests to your Review queue. If you do not select an action that routes a request elsewhere (to lenders, purchase, or Document Delivery), this action will apply by default.

**Available additional Actions**

▪ Apply Constant Data
▪ Build Lender String

**Route Request to Review for Purchase**

Requests will be sent to your [Purchasing Requests](#) > [Review for Purchase](#) queue.

▪ No available additional Actions.

**Send Request to Lenders**

▪ Select this option if you want to route the request
automatically to lenders.

- Once you select this option, you will be asked to select a Custom Holdings Path from the full list of Custom Holdings Paths currently configured for your institution. Matching requests will be routed to lenders in the Custom Holdings Path you select who hold the requested item.
  - You will also be asked to select the minimum number of lenders in your selected Custom Holdings Path who hold the requested item.
    - This is not the overall number of libraries who have WorldCat holdings on the requested item. This is the minimum number of lenders in your designated Custom Holdings Path who should hold the item before the request is sent automatically to those lenders.
- If this acts on a loan request, you should also specify an action to Apply Constant Data and then select the constant data record of your choice. The constant data record you select should include shipping and billing addresses. If you do not specify a constant data record with this action, your request will be moved to review with a message in Automation History stating that shipToAddress1 and/or the billToAddress1 is missing.
  - **Print Serials**
    - Lenders will be excluded from the lender string if they:
      - Do not hold the requested year or volume based on the information in the 853 and 863 fields of the Local Holdings Record (LHR)
      - Have a title-level deflection in the 008 field of the LHR indicating they will not lend or copy the item.
    - Once these lenders have been excluded, the remaining lenders are sorted by turnaround time.
  - **Turnaround time**
    - Turnaround time is calculated from when a lender is assigned a request to the time when the item is available to the borrower.
For Loans: the time from when the lender was assigned to when the borrower received the item.

For Copies: the time from when the lender was assigned to when the lender shipped the item.

Lenders are sorted by turnaround time within each Custom Holdings Group in a Custom Holdings Path. User's preferences for ordering the lender string are retained. Turnaround time order is determined by the below calculations to create the best lender string for each request without overwhelming lenders who have a quick turnaround time:

- The system calculates a daily average turnaround time for lenders based on historical data from the past year. This average turnaround time is recalculated daily.
- Each library’s current queue depth or number of outstanding lending requests is considered upon assigning requests. The current queue depth is calculated hourly.

Available additional Actions

- Apply Constant Data

### Automation Exceptions

<table>
<thead>
<tr>
<th>FIELD</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>If Duplicate Request, Route to Review</td>
<td>Potential duplicate requests will be sent to your Review File.</td>
</tr>
<tr>
<td>If Held By Custom Holdings Group, Route to Review</td>
<td>If you want requests matching this automation to be routed to your Review File when one or more members of a particular group holds the requested item, select the name of the Custom Holdings group record that identifies the group. Select one group</td>
</tr>
</tbody>
</table>
name from the list provided.

- The list includes all current Custom Holdings groups for your institution. If group holdings are not relevant to the set of requests you are automating, do not select a Custom Holdings group.

**Examples:**

- The group name that represents all library branches on your campus.
- The group name that represents consortia for which you have special borrowing procedures.

### If Held By My Institution, Route to Review

Requests will be sent to your Review File when your institution holds the requested item.

### Using automations with WorldShare Interlibrary Loan

Automations allow you to determine how patron-generated requests are processed. Once a patron request has been submitted, with an automation, you can select whether the request, if matching the automation, should be produced (sent) to lenders or forwarded to your New for Review queue.

Keep the following in mind when you are creating your automations:

- Automations are applied based on the **Priority** setting. A patron-generated request is compared against all automations. Of all the automations that match the request, the automation with the highest priority, or lowest assigned Priority number, will be applied to the request.
  - Each automation must have a unique numerical value for **Priority**.
- OCLC recommends creating an Automation for loans and an Automation for copies.

### Basic automations

A recommended set of automations would **Route Request to Review** if the request is a duplicate or **Route Request to Review** if the item is held. If this automation is not configured, the system applies constant data and moves the request to review.

**Examples**
1. **LOANS:**

If the request is not a duplicate and is not held by your institution, the system will apply the Constant Data record and build a lender string based on the holding libraries in the Custom Holdings Path and route the request to Review.

1. Under **Matches**, select **Request Type > Loan**.
2. Click the **Add an Exception** option and select **If Duplicate Request, Route to Review**.
3. Click the **Add an Exception** option and select **If Held By My Institution, Route to Review**.
4. Under **Actions**, select **Send Request to Lenders** and select the Custom Holdings Path to use.
5. Click the **Add an Action** option and select **Apply Constant Data** and select the Constant Data record to use.

2. **COPIES:**

If the request is not a duplicate and is not held by your institution, the system will apply the Constant Data record and build a lender string based on the holding libraries in the Custom Holdings Path and route the request to Review.

1. Under **Matches**, select **Request Type > Copy**.
2. Click the **Add an Exception** option and select **If Duplicate Request, Route to Review**.
3. Click the **Add an Exception** option and select **If Held By My Institution, Route to Review**.
4. Under **Actions**, select **Send Request to Lenders** and select the Custom Holdings Path to use.
5. Click the **Add an Action** option and select **Apply Constant Data** and select the Constant Data record to use.

### Advanced automations

The following are examples of how to expand your automations.

**Examples**
1. **PATRONNOTE**

Any requests that have a patron note will not be sent to lenders, allowing for staff to read the patron’s note and fill the request accordingly.

1. Under **Matches**, select **Patron Note**. Select the **Any words** checkbox to retrieve requests that have any patron note.
2. Under **Actions**, select **Route Request to Review**.

2. **PURCHASE**

Spanish Book requests will be routed to review for purchase.

1. Under **Matches**, select **Formats > Book**.
2. Select 🔄 **Add a match** and select **Language > Spanish**.
3. Under **Actions**, select **Route Request to Review for Purchase**.
