How do I set up a print exception for the courier service?

Applies to

- ILLiad

Answer

Use the Print Configurations filter option to set up a match string like you would with a routing rule. To learn how to limit on what is printed so that it does not include the courier service, follow the [Sorting and Filtering Print Documents](https://help.oclc.org/Resource_Sharing/ILLiad/Troubleshooting/How_do_I_set_up_a_print_exception_for_the_courier_service/) document from Atlas. This depends on what field is being used for the option to show up as a courier. For example, is it the ShippingOptions field? Then the filter would be Transactions.ShippingOptions <> 'courier'. That would print everything that is not using the ShippingOptions of courier.
