TLC authentication

Last updated: Fri, 30 Mar 2018 20:23:56 GMT

EZproxy can be configured to verify patron information against the account feature of a TLC server. A sample configuration is:

```plaintext
::TLC
Unauthenticated; Stop
/TLC
```

where the URL is found by accessing the Patron Review page, viewing that page's source, searching for `<form` and then using the name of the server and the action of the form tag.

In addition to the directives shown, the TLC block may also incorporate any of the [common conditions and actions](https://help.oclc.org/Library_Management/EZproxy/Authenticate_users/EZproxy_authentication_methods/TLC_authentication).
