Learn how to use the DenyIfRequestHeader config.txt directive to specify browser headers to indicate that access should be denied to EZproxy.

**DenyIfRequestHeader** specifies browser headers that, if present in EZproxy requests, indicate that access should be denied to EZproxy. It is extremely unusual to deny access to EZproxy based on a header sent by a browser, but if this action is required this directive should be used.

**DenyIfRequestHeader** is a repeatable, position-dependent config.txt directive. Optional *filename* is a user visible document of this directive.

**Qualifiers**

<table>
<thead>
<tr>
<th>QUALIFIER</th>
<th>DESCRIPTION</th>
</tr>
</thead>
</table>
| wildheader | The header that indicates the access should be denied, which may include the * wildcard to match zero or more characteristics and the ? wildcard to match any one character.  
Note: *Wildheader* may not contain any spaces. |

**Options**

<table>
<thead>
<tr>
<th>OPTION</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow</td>
<td>If allow appears after the <em>wildheader</em>, then any further DenyIfRequestHeader directives should be ignored and access should be granted.</td>
</tr>
<tr>
<td>filename</td>
<td>If the <em>wildheader</em> matches and <em>filename</em> is specified, EZproxy should send the content of <em>filename</em> to indicate why access is being denied.</td>
</tr>
</tbody>
</table>

**Syntax**

```
DenyIfRequestHeader denyfile wildcardtest
```

**Examples**

Deny access to Google indexing robot:

```
DenyIfRequestHeader User-Agent:*GoogleBot*
```
Deny access for people using a fictional, incompatible XYZ browser and give them feedback:

| DenyIfRequestHeader User-Agent *XYZ* XYZFailsHere.htm |
