Option ForceHTTPSLogin

Learn how to use the Option ForceHTTPSLogin config.txt directive to redirect users to a secure login page in EZproxy. By including Option ForceHTTPSLogin in your config.txt, your users will be redirected to a secure login page whenever they try to access EZproxy resources. This security configuration is one step to help keep your server and users' credentials secure.

Option ForceHTTPSLogin is a position-independent config.txt that presents the login page with a secure https protocol at the beginning of the URL. To use this directive, you must configure your EZproxy to use a secure certificate encrypted with SSL (Secure Socket Layer) technology. For details about SSL Configuration, see SSL Configuration.

Syntax

| Option ForceHTTPSLogin

This will cause EZproxy to redirect any requests for the login page to the secure, https URL.

Example

To use Option ForceHTTPSLogin, you need to configure EZproxy to listen on a secure port and configure EZproxy to use an SSL certificate. Once you have completed the steps in SSL Configuration, you can enter the following lines in your config.txt to cause EZproxy to redirect to a secure login page whenever a login page is requested:

| LoginPortSSL 443
| Option ForceHTTPSLogin

These lines can be entered anywhere in your config.txt; however, most institutions enter these statements towards the top along with other EZproxy configuration information to keep these details separate from the database stanzas.
