Learn how to use the `Option LogUser` config.txt directive to specify the username provided while logging into EZproxy with other log directives. `Option LogUser` specifies that the username provided while logging into EZproxy should be substituted for `%u` in log formats specified with the `LogFormat` or `LogSPU` directives. By including this option in config.txt, your web server log analysis software may be able to link together all of the requests placed by a given user across all EZproxy sessions.

If `Option LogSession` and `Option LogUser` both appear in config.txt, then `Option LogSession` takes priority and prevents `Option LogUser` from having any effect.

If you want to record both the login username and the session identifier, use `Option LogUser` to allow `%u` to be recorded as the username, and `%{ezproxy-session}` to record the session identifier.

Option LogUser is a non-repeatable position-independent config.txt directive.

**Syntax**

```
Option LogUser
```

**Example**

Enable the username provided during login to be recorded in EZproxy web server log files.

```
Option LogUser
```

**Related directives**

- `LogFormat`
- `LogSPU`
- `Option LogSession`
