Learn how to use the Option LogUser config.txt directive to specify the username provided while logging into EZproxy with other log directives. **Option LogUser** specifies that the username provided while logging into EZproxy should be substituted for %u in log formats specified with the LogFormat or LogSPU directives. By including this option in config.txt, your web server log analysis software may be able to link together all of the requests placed by a given user across all EZproxy sessions.

If **Option LogSession** and **Option LogUser** both appear in config.txt, then **Option LogSession** takes priority and prevents **Option LogUser** from having any effect.

If you want to record both the login username and the session identifier, use **Option LogUser** to allow %u to be recorded as the username, and %{ezproxy-session}i to record the session identifier.

**Option LogUser** is a non-repeatable position-independent config.txt directive.

**Syntax**

- Option LogUser

**Example**

Enable the username provided during login to be recorded in EZproxy web server log files.

- Option LogUser

**Related directives**

- LogFormat, LogSPU, Option LogSession
