Learn how to use the Option LogUser config.txt directive to specify the username provided while logging into EZproxy with other log directives.

**Option LogUser** specifies that the username provided while logging into EZproxy should be substituted for $u in log formats specified with the **LogFormat** or **LogSPU** directives. By including this option in config.txt, your web server log analysis software may be able to link together all of the requests placed by a given user across all EZproxy sessions.

If **Option LogSession** and **Option LogUser** both appear in config.txt, then **Option LogSession** takes priority and prevents **Option LogUser** from having any effect.

If you want to record both the login username and the session identifier, use **Option LogUser** to allow $u to be recorded as the username, and ${{ezproxy-session}} to record the session identifier.

Option LogUser is a non-repeatable position-independent config.txt directive.

**Syntax**

| Option LogUser |

**Example**

Enable the username provided during login to be recorded in EZproxy web server log files.

| Option LogUser |
